Hematologic Toxicity:

2.3 Dose Adjustments and Modifications

Treatment should continue as long as patients are clinically benefiting from therapy. Daily at approximately 12 hour intervals for 7 consecutive days every 28 days, over a 28-day cycle. After initial maintenance cycles, monitor CBCs every two weeks or as clinically indicated. If a

Perform complete blood counts (CBCs) weekly during induction and initial maintenance cycles. After initial maintenance cycles, monitor CBCs every two weeks or as clinically indicated. If a patient experiences Grade 4 neutropenia (absolute neutrophil count (ANC) less than 0.5 x 10^9/L) or Grade 3 thrombocytopenia (platelet counts less than 50 x 10^9/L) during a cycle, delay starting the next cycle until ANC is greater than or equal to 1.0 x 10^9/L and platelet count is greater than or equal to 50 x 10^9/L. Also, for the next cycle, reduce the number of dosing days by 2 days (e.g. to 12 or 5 days).

Non-Hematologic Toxicity:

Manage other clinically significant non-hematologic toxicity symptomatically. Interrupt and/or delay SYNRIBO until toxicity is resolved.

2.4 Reconstitution Instructions and Handling Precautions

SYNRIBO should be prepared in a healthcare facility and must be reconstituted by a healthcare professional. Reconstitute SYNRIBO with one mL of 0.9% Sodium Chloride Injection, USP, prior to subcutaneous injection. After addition of the diluent, gently swirl until a clear solution is obtained. The lyophilized powder should be completely dissolved in less than one minute. The resulting solution is clear and colorless and contains 3.5 mg/mL SYNRIBO. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration whenever solution and container permit. SYNRIBO does not contain antimicrobial preservatives. Therefore care must be taken to ensure that the solution for injection is not contaminated during preparation.

SYNRIBO is a cytotoxic drug. Follow special handling and disposal procedures. 1. Wear protective gloves and clothing. 2. Wear personal protective equipment (PPE) appropriate for the type of particulate matter that may be present. 3. Avoid skin and eye contact. 4. Avoid inhalation of the drug or its volatile components. 5. Avoid ingestion of the drug. 6. Avoid contact with the mucous membranes. 7. Avoid direct contact with clothing. 8. Use only for the intended purpose.

1. Maintenance Dosing

The recommended starting schedule for induction is 1.25 mg/m^2 administered subcutaneously twice daily at approximately 12 hour intervals for 14 consecutive days of a 28-day cycle (2.1). Maintenance Dose: 1.25 mg/m^2 administered by subcutaneous injection twice daily for 7 consecutive days of a 28-day cycle (2.2).

Dose modifications are needed for toxicity (2.3).

For Injection: Single-dose vial containing 3.5 mg of omacetaxine mepesuccinate as a lyophilized powder (3).
SYNRIBO® (omacetaxine mepesuccinate) for injection

administration, disposal, and clean-up of accidental spillage of the product. Ensure that patients receive the necessary supplies for home administration. At minimum these should include:

• Reconstituted SYNRIBO in syringe with a capped needle for subcutaneous injection. Syringe(s) should be filled to the patient-specific dose.

• Protective eyewear

• Gloves

• An appropriate biohazard container

• Absorbent pad(s) for placement of administration materials and for accidental spillage

• Alcohol swabs

• Gauze pads

• Ice packs or cooler for transportation of reconstituted SYNRIBO syringes

If a patient or caregiver cannot be trained for any reason, then in such patients, SYNRIBO should be administered by a healthcare professional.

2.7 Disposal and Accidental Spillage Procedures

After administration, any unused solution should be discarded properly. Instruct patients planning home administration of the following: do not recap or clip the used syringe, do not place used needles, syringes, vials, and other used supplies in a household trash or recycling bin. Used needles, syringes, vials, and other used supplies should be disposed of in an appropriate biohazard container. If accidental spillage occurs, continue to use protective eyewear and gloves, wipe the spilled liquid with the absorbent pad, and wash the area with water and soap. Then, place the pad and gloves into the biohazard container and wash hands thoroughly. Return the biohazard container to the clinic or pharmacy for final disposal.

3 DOSAGE FORMS AND STRENGTHS

SYNRIBO for Injection contains 35 mg omacetaxine mepesuccinate; as a sterile, preservative-free, white to off-white lyophilized powder in a single-dose vial.

4 CONTRAINDICATIONS

None.

5 Warnings and Precautions

5.1 Myelosuppression

In uncontrolled trials with SYNRIBO, patients with chronic phase and accelerated phase CML experienced NCI CTC (version 3.0) Grade 3 or 4 thrombocytopenia (85%, 88%), neutropenia (81%, 71%), and anemia (62%, 80%), respectively. Fatalities related to myelosuppression occurred in 3% of patients in the safety population (N=163). Patients with neutropenia are at increased risk for infections, and should be monitored frequently and advised to contact a physician if they have symptoms of infection or fever.

Monitor complete blood counts weekly during induction and initial maintenance cycles and every two weeks during later maintenance cycles, as clinically indicated. In clinical trials myelosuppression was generally reversible and usually managed by delaying next cycle and/or reducing days of treatment with SYNRIBO [see Dosage and Administration (2.3) and Adverse Reactions (6.1)].

5.2 Bleeding

SYNRIBO causes severe thrombocytopenia which increases the risk of hemorrhage. In clinical trials with CP and AP CML patients, a high incidence of Grade 3 and 4 thrombocytopenia (85% and 88%, respectively) was observed. Fatalities from cerebral hemorrhage occurred in 2% of patients treated with SYNRIBO in the safety population. Severe, non-fatal, gastrointestinal hemorrhages occurred in 2% of patients in the same population. Most bleeding events were associated with severe thrombocytopenia. Monitor platelet counts as part of the CBC monitoring as recommended [see Warnings and Precautions (5.1)]. Avoid anticoagulants, aspirin, and non-steroidal anti-inflammatory drugs (NSAIDs) when the platelet count is less than 50,000/µL as they may increase the risk of bleeding.

5.3 Hyperglycemia

SYNRIBO can induce glucose intolerance. Grade 3 or 4 hyperglycemia was reported in 11% of patients in the safety population. Hyperosmolar non-ketotic hyperglycemia occurred in 1 patient treated with SYNRIBO in the safety population. Monitor blood glucose levels frequently, of patients in the safety population. Hyperosmolar non-ketotic hyperglycemia occurred in 1 patient treated with SYNRIBO in the safety population. Monitor blood glucose levels frequently, especially in patients with diabetes or risk factors for diabetes. Avoid SYNRIBO in patients with poorly controlled diabetes mellitus until good glycemic control has been established.

5.4 Embryo-Fetal Toxicity

Based on findings from animal reproduction studies and the drug's mechanism of action, SYNRIBO can cause fetal harm when administered to a pregnant woman. Advise pregnant women of the potential risk to a fetus. Advise females of reproductive potential to use an effective method of contraception during treatment with SYNRIBO and for 6 months after the final dose [see Use in Specific Populations (8.1, 8.3) and Clinical Pharmacology (12.1)].

Advise males with female partners of reproductive potential to use effective contraception during treatment with SYNRIBO and for 3 months after the final dose [see Use in Specific Populations (8.3)].

6 Adverse Reactions

The following clinically significant adverse reactions have been associated with SYNRIBO in clinical trials and are discussed in greater detail in other sections of the label.

• Myelosuppression [see Warnings and Precautions (5.1)]

• Bleeding [see Warnings and Precautions (5.2)]

• Hyperglycemia [see Warnings and Precautions (5.3)]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety data for SYNRIBO are from 3 clinical trials which enrolled a total of 163 adult patients with chronic phase and/or intolerant chronic phase (N=108) and accelerated phase (N=55) CML. All patients were treated with initial induction therapy consisting of a dose of 1.25 mg/m2 administered subcutaneously twice daily for 14 consecutive days every 28 days (induction cycle). Responding patients were then treated with the same dose and a twice daily schedule for 7 consecutive days every 28 days (maintenance cycle).

6.2 Adverse Reactions Leading to Discontinuation

Of the 91 patients who received at least 2 cycles of treatment, 79 (87%) had at least 1 cycle delay during the trials. The median number of days of cycle delays was greatest for cycle 2 (27 days) and cycle 3 (32 days) when more patients were receiving induction cycles. Adverse reactions were reported for 95% of the patients with chronic phase CML. A total of 18% of patients had adverse reactions leading to withdrawal. The most frequently occurring adverse reactions leading to discontinuation were pancytopenia, thrombocytopenia, and increased alamine aminotransferase (each 2%). A total of 87% of patients reported at least 1 Grade 3 or Grade 4 treatment emergent adverse reaction (Table 2).

</table>

* Occurred in the period between the first dose and 30 days after the last dose.

b Includes infusion related reaction, injection site erythema, injection site hematoma, injection site hemorrhage, injection site hypersensitivity, injection site induration, injection site inflammation, injection site irritation, injection site mass, injection site edema, injection site puritus, injection site rash, and injection site reaction.

c Includes infection, bacterial, viral, and nonspecific.

Serious adverse reactions were reported for 5% of patients. Serious adverse reactions reported for at least 5% of patients were bone marrow failure and thrombocytopenia (each 10%), and febrile neutropenia (6%). Serious adverse reactions of infections were reported for 5% of patients.

Death occurred while on study in five (5%) patients with CP CML. Two patients died due to cerebral hemorrhage, one due to multi-organ failure, one due to progression of disease, and one from unknown causes.

Accelerated Phase CML

Median total cycles of exposure was 2 (range 1 to 29), and the median total dose delivered during the trials was 70 mg/m2. The median duration of exposure for the 55 patients with accelerated phase CML was 1.9 months (range 0 to 30 months). Of the patients with accelerated phase CML, 86% received 14 days of treatment during cycle 1. By cycles 2 and 3, the percentage of patients receiving 14 days of treatment decreased to 46% and 16% respectively. Of the 91 patients who received at least 2 cycles of treatment, 79 (87%) that had at least 1 cycle delay during the trials. The median number of days of cycle delays was greatest for cycle 3 (31 days) and cycle 4 (36 days).
SYNRIBO® (omacetaxine mepesuccinate) for injection

Adverse reactions regardless of investigator attribution were reported for 100% patients with accelerated phase CML. A total of 13% of patients had adverse reactions leading to withdrawal. The most frequently occurring adverse reactions leading to withdrawal were leukocytosis (6%), and thrombocytopenia (4%). A total of 84% of patients reported at least 1 Grade 3 or Grade 4 treatment emergent adverse reaction (Table 3).

* Infection includes bacterial, viral, fungal, and non-specified.

Serious adverse reactions were reported for 60% of patients. Serious adverse reactions reported for at least 5% of patients were febrile neutropenia (18%), thrombocytopenia (9%), anemia (7%), and diarrhea (6%). Serious adverse reactions of infections were reported for 3% of patients. Death occurred while on study in 5 (9%) patients with AP CML. Two patients died due to cerebral hemorrhage and three due to progression of disease.

Laboratory Abnormalities in Chronic and Accelerated Phase CML

Grade 3/4 laboratory abnormalities reported in patients with chronic and accelerated phase CML are described in Table 4. Myelosuppression occurred in all patients treated with SYNRIBO [see Warnings and Precautions (5.1)]. Five patients with chronic phase CML and 4 patients with accelerated phase CML permanently discontinued SYNRIBO due to pancytopenia, thrombocytopenia, febrile neutropenia, or bone marrow necrosis. An event of hyperosmolar non-ketotic hyperglycemia was reported in one patient in the safety population and a similar case has been reported in the literature. Two patients with chronic phase CML permanently discontinued SYNRIBO due to elevated transaminases.

6.2 Additional Data from Safety Population

The following adverse reactions were reported in patients in the SYNRIBO clinical studies of patients with chronic phase and accelerated phase CML at a frequency of 1% to less than 10%.

Cardiac Disorders: tachycardia, palpitations, acute coronary syndrome, angina pectoris, arrhythmia, bradycardia, ventricular extrasystoles.

Ear and Labyrinth Disorders: ear pain, ear hemorrhage, tinnitus.

Eye Disorders: cataract, vision blurred, conjunctival hemorrhage, dry eye, lacrimation increased, conjunctivitis, diplopia, eye pain, eyelid edema.

Gastrointestinal Disorders: stomatitis, mouth ulceration, abdominal distension, dyspepsia, gastrosophageal reflux disease, gingival bleeding, aphthous stomatitis, dry mouth, hemorrhoids, gastritis, gastrointestinal hemorrhage, melena, mouth hemorrhage, oral pain, anal fissure, dysphagia, gingival pain, gingivitis.

General Disorders and Administration Site Conditions: mucosal inflammation, pain, chest pain, hyperthermia, influenza like illness, catheter site pain, general edema, malaise.

Immune System Disorders: hypersensitivity.

Injury, Poisoning and Procedural Complications: contusion, transfusion reaction.

Metabolism and Nutrition Disorders: decreased appetite, diabetes mellitus, gout, dehydration.

Musculoskeletal and Connective Tissue Disorders: bone pain, myalgia, muscular weakness, muscle spasms, musculoskeletal chest pain, musculoskeletal pain, musculoskeletal stiffness, musculoskeletal discomfort.

Nervous System Disorders: dizziness, cerebral hemorrhage, paresthesia, convolution, hypotension, lethargy, scatica, burning sensation, dysgeusia, tremor.

Psychiatric Disorders: anxiety, depression, agitation, confusional state, mental status change.

Renal and Urinary Disorders: dysuria.

Respiratory: Thoracic and Mediastinal Disorders: pharyngolaryngeal pain, nasal congestion, dysphonia, productive cough, rales, rhinorrhoea, hemoptysis, sinus congestion.

Skin and Subcutaneous Tissue Disorders: erythema, pruritus, dry skin, petechiae, hyperhidrosis, night sweats, ecchymosis, purpura, skin lesion, skin ulcer, rash erythematous, rash papular, skin exfoliation, skin hypogamnitation.

Vascular Disorders: hematoma, hypertension, hot flush, hypotension.

8. USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

Based on its mechanism of action and findings from animal studies, SYNRIBO can cause fetal harm when administered to pregnant women. In animal reproduction studies, subcutaneous administration of omacetaxine mepesuccinate to pregnant mice during organogenesis at doses approximately 0.25 to 0.5 times the maximum recommended human doses (MRHD) resulted in embryo-fetal mortality, structural abnormalities, and alterations to growth (see Data). There are no available data on SYNRIBO use in pregnant women to evaluate for a drug-associated risk of major birth defects, miscarriage or adverse maternal or fetal outcomes. Advise pregnant women of the potential risk to a fetus [see Warnings and Precautions (5.4)].

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% and 15 to 20%, respectively.

Data

Animal Data

In an embryo-fetal development study, pregnant mice were administered omacetaxine mepesuccinate subcutaneously during the period of organogenesis at doses of 0.63 or 1.23 mg/kg/day (approximately 0.25 to 0.5 times the MRHD on a body surface area basis). Drug-related adverse effects included embryonic death, an increase in unossified bones/reduced bone ossification, and decreased fetal body weights. Fetal toxicity occurred at doses of 1.23 mg/kg/day, which is approximately half the recommended daily human dose.

8.2 Lactation

Risk Summary

There are no data on the presence of omacetaxine mepesuccinate in either human or animal milk, the effects on the breastfed child, or the effects on milk production. Because of the potential for serious adverse reactions in the breastfed child, advise patients that breastfeeding is not recommended during treatment with SYNRIBO, and for 2 weeks after the final dose.

8.3 Females and Males of Reproductive Potential

Pregnancy Testing

Pregnancy testing is recommended for females of reproductive potential prior to initiating SYNRIBO.

Contraception

Females

SYNRIBO can cause embryo-fetal harm when administered to pregnant women [see Use in Specific Populations (8.1)]. Advise female patients of reproductive potential to use effective contraception during treatment with SYNRIBO and for 6 months after the final dose [see Nonclinical Toxicology (13.1)].

Infertility

Males

Based on findings from animal studies, SYNRIBO may impair male fertility. Studies in mice demonstrated adverse effects on male reproductive organs where bilateral degeneration of the seminiferous tubular epithelium in testes and hypospermatia/aspermatia were observed [see Nonclinical Toxicology (13.1)]. The long-term effects of SYNRIBO on male fertility, including the reversibility of adverse effects, have not been studied.

8.4 Pediatric Use

The safety and effectiveness of SYNRIBO in pediatric patients have not been established.
8.5 Geriatric Use
In the chronic and accelerated phase CML efficacy populations 23 (30%) and 16 (46%) patients were ≥65 years of age. For the age subgroups of <65 years of age and ≥65 years of age, there were differences between the subgroups, with higher rates of major cytogenetic responses (MCyRs) in younger patients with CP CML compared with older patients (23% vs. 9%, respectively) and higher rates of major hematologic responses (MaHRs) in older patients with AP CML compared with younger patients (31% vs. 0%, respectively). Patients ≥65 years of age were more likely to experience toxicity, most notably hematologic toxicity.

8.6 Effect of Gender
Of the 76 patients included in the chronic phase CML population efficacy analysis, 47 (62%) of the patients were men and 29 (38%) were women. For patients with chronic phase CML, the MCyR rate in men was higher than in women (21% vs. 14%, respectively). There were differences noted in the safety profile of omacetaxine mepesuccinate in men and women with chronic phase CML although the small number of patients in each group prevents a definitive assessment.

10 OVERDOSAGE
A patient in the clinical expanded access program received an overdose of 2.5 mg/m² twice daily for 5 days in the 16th cycle. The patient presented with gastrointestinal disorders, gingival hemorrhage, alopecia, and Grade 4 thrombocytopenia and neutropenia. When SYNRIBO treatment was temporarily interrupted the gastrointestinal disorders and hemorrhagic syndrome resolved, and neutrophil values returned to within normal range. The alopecia and thrombocytopenia (Grade 1) improved, and SYNRIBO was restarted. No specific antidote for SYNRIBO overdose is known. Management of overdose should include general supportive measures, including monitoring of hematologic parameters.

11 DESCRIPTION
SYNRIBO contains the active ingredient omacetaxine mepesuccinate, a cephalotaxine ester. It is a protein synthesis inhibitor. Omacetaxine mepesuccinate is prepared by a semi-synthetic process from cephalotaxine, an extract from the leaves of Cephalotaxus sp. The chemical name of omacetaxine mepesuccinate is cephalotaxine, 4-methyl (2R)-hydroxyl-2-(4-hydroxyl-4-methylpentyl) butane diester (ester).

Omacetaxine mepesuccinate has the following chemical structure:

\[
\text{C}_{29}\text{H}_{39}\text{NO}_{9}\n\]

The molecular formula is C_{29}H_{39}NO_{9} with a molecular weight of 545.6 g/mol. SYNRIBO for Injection is a sterile, preservative-free, white to off-white, lyophilized powder in a single-dose vial. Each vial contains 5.6 mg omacetaxine mepesuccinate, 60 mg hydrochloric acid for drug substance solubilization, 10 mg mannitol as a bulking agent, and hydrochloric acid and sodium bicarbonate to adjust pH to 6.

12 CLINICAL PHARMACOLOGY
12.1 Mechanism of Action
The mechanism of action of omacetaxine mepesuccinate has not been fully elucidated but includes inhibition of protein synthesis and is independent of direct Bcr-Abl binding. Omacetaxine mepesuccinate binds to the A-site cleft in the peptidyl-transferase center of the large ribosomal subunit from a strain of anchovys. In vitro, omacetaxine mepesuccinate reduced protein levels of the Bcr-Abl oncprotein and Mcl-1, an anti-apoptotic Bcl-2 family member. Omacetaxine mepesuccinate showed activity in mouse models of wild-type and T315I mutated Bcr-Abl CML.

12.2 Pharmacokinetics
Cardiac Electrophysiology
In an uncontrolled pharmacokinetic study there were no reports of QTc F > 480 ms or ΔQTc F > 60 ms in 21 treated patients who received omacetaxine mepesuccinate 125 mg/m² BID for 14 consecutive days. There was no evidence for concentration-dependent increases in QTc for omacetaxine mepesuccinate or 4'-DMHHT. Although the mean effect on QTc was 4.2 ms (upper 95% CI: 9.5 ms), QTc effects less than 10 ms cannot be verified due to the absence of a placebo and positive controls.

12.3 Pharmacokinetics
The dose proportionality of omacetaxine mepesuccinate is unknown. A 90% increase in systemic exposure to omacetaxine mepesuccinate was observed between the first dose and steady state.

Absorption
The absolute bioavailability of omacetaxine mepesuccinate has not been determined. Omacetaxine mepesuccinate is absorbed following subcutaneous administration, and maximum concentrations are achieved after approximately 30 minutes.

Distribution
The steady-state (mean ± SD) volume of distribution of omacetaxine mepesuccinate is approximately 141 ± 33.4 L following subcutaneous administration of 125 mg/m² twice daily for 11 days. The plasma protein binding of omacetaxine mepesuccinate is less than or equal to 50%.

Elimination
The terminal elimination half-life of omacetaxine mepesuccinate in plasma is 14.6 hours.

Metabolism
Omacetaxine mepesuccinate is primarily hydrolyzed to 4’-DMHHT via plasma esterases with little hepatic microsomal oxidative and/or esterase-mediated metabolism in vitro.

Cytogenetic response evaluation is based on standard cytogenetic analysis (at least 20 metaphases).

Complete: 0% Ph + cells, Partial: 0% to 35% Ph + cells

The mean time to MCyR onset in the 14 patients was 3.5 months. The median duration of MCyR for the 14 patients was 12.5 months (Kaplan-Meier estimate). Accelerated Phase CML (AP CML)

A total of 35 patients with accelerated phase CML were included in the efficacy analysis. The demographics were: median age was 63 years, 57% were male, 46% were 65 years of age or older, 80% were Caucasian, 5% were African-American, 4% were Asian and 4% were Hispanic. Thirty-six (47%) patients had failed treatment with imatinib, dasatinib, and nilotinib. Most patients had also received prior non-TKI treatments, most commonly hydroxyurea (54%), interferon (30%), and/or cytarabine (29%). The efficacy endpoint was based on MCyR (adjudicated by a DMC).

**Primary Response – MCyR**

Total with MCyR, n (%) 0

MaHR is defined as complete hematologic response (CHR) or no evidence of leukemia (NEL): CHR: absolute neutrophil count ≥ 1.5 × 10^9/liter, platelets ≥ 100 × 10^9/liter, no blood blasts, bone marrow blasts < 5%, no extramedullary disease; NEL - Morphologic leukemia-free state, defined as <5% bone marrow blasts.

The mean time to response onset in the 5 patients was 2.3 months. The median duration of MaHR for the 5 patients was 4.7 months (Kaplan-Meier estimate).

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

SYNRIBO (omacetaxine mepesuccinate) for Injection is supplied in 8 mL clear glass single-dose vial in individual cartons. Each vial contains 3.5 mg of SYNRIBO (omacetaxine mepesuccinate) for Injection (NDC 63459-177-14). SYNRIBO (omacetaxine mepesuccinate) is a cytotoxic drug. Follow special handling and disposal procedures.

17 PATIENT COUNSELING INFORMATION

Availability of Medication Guide and Instructions for Use

Advise the patient and/or caregiver to read the FDA-approved patient labeling (Medication Guide and Instructions for Use). Assist patients and caregivers in understanding their contents and give them the opportunity to discuss the contents of the Medication Guide and Instructions for Use and to obtain answers to any questions they may have prior to initiating therapy. The complete text of the Medication Guide and Instructions for Use are attached to the prescribing information.

Patient Training

Once it is determined that a patient is an appropriate candidate for self-administration or administration by a caregiver, ensure that patients receive the necessary supplies for home administration of SYNRIBO and train them on the following (see Dosage and Administration 2.4, 2.5, 2.6, 2.7.1):

- How to transport reconstituted SYNRIBO in a secure container or packaging and under recommended temperature conditions.
- Acceptable storage conditions and use times for reconstituted SYNRIBO:
  - When stored in a refrigerator (2°C to 8°C [36°F to 46°F]), use within 6 days (144 hours).
  - When stored at room temperature (not to exceed 25°C [77°F]), use within 12 hours.
- If stored in a refrigerator, keep SYNRIBO from coming into contact with food or drink.
- To wear disposable gloves and protective eyewear when handling SYNRIBO.
- To wash hands before putting on gloves and after removing gloves.
- Not to eat or drink while handling SYNRIBO. To administer SYNRIBO in an area away from food or food preparation areas.
- To administer SYNRIBO in a location away from children and pregnant women.
- To administer SYNRIBO at a site that is not tender, red, bruised, or that has scars or stretch marks.
- The importance of body site selection for administering the injection, as well as the importance of alternating the injection sites. Advise patients not to inject SYNRIBO into areas of the skin that are tender, red, bruised, hard, or that have scars or stretch marks.
- In the case of a missed dose: If a patient misses an injection, skip the missed dose and the patient should give the next scheduled injection at the next scheduled time. Inform patients not to give two injections to make up for a missed injection.
- In the case that SYNRIBO comes into contact with a patient’s skin or eyes: Advise patients to wash exposed skin with soap and water and in the case of eye exposure, thoroughly flush the eye with water. After washing or flushing, advise patients to call their healthcare provider immediately.
- In the case that too much SYNRIBO is injected or that SYNRIBO is accidentally swallowed: Instruct patients to contact their healthcare provider immediately if they have injected too much SYNRIBO, or if someone has swallowed SYNRIBO.
- Disposal procedures, including use of an appropriate biohazard container and return of the container to the clinic or pharmacy for final disposal. Inform patients not to recap or clip the used needle and do not to place used needles, syringes, vials, and other used supplies in a household trash or recycle container.
- Accidental spillage procedures, including wiping the spilled liquid with the absorbent pad (using protective eyewear and gloves), washing the area with water and soap, and proper disposal of materials.

Myelosuppression

Advise patients of the likelihood that SYNRIBO will cause a decrease in white blood cells, platelets, and red blood cells and that monitoring of these parameters will be needed. Instruct patients to contact a health care professional if they develop a fever, or other signs/symptoms of infection; shortness of breath, significant fatigue, or bleeding (see Warnings and Precautions 5.3).

16.2 Storage and Handling

Store unopened vials at 20°C to 25°C (68°F to 77°F); excursions permitted from 15°C to 30°C (59°F to 86°F) [see USP Controlled Room Temperature]. Prior to re-constitution, keep product in carton to protect from light.

16.3 Stability

Acceptable storage conditions and use times for reconstituted SYNRIBO:

- When stored at room temperature (not to exceed 25°C [77°F]), use within 12 hours.
- When stored in a refrigerator (2°C to 8°C [36°F to 46°F]), use within 6 days (144 hours).
- When stored at room temperature (not to exceed 25°C [77°F]), use within 12 hours.

Bleeding

Advising patients of the possibility of serious bleeding due to low platelet counts, instruct patients to report immediately any signs or symptoms suggestive of hemorrhage (unusual bleeding, easy bruising or blood in urine or stool; confusion, slurred speech, or altered vision). Instruct patients to report in advance if they plan to have any dental or surgical procedures (see Warnings and Precautions 5.2).

Hyperglycemia

Advise patients with diabetes of the possibility of hyperglycemia and the need for careful monitoring of blood glucose levels. Patients with poorly controlled diabetes mellitus should not be treated with omacetaxine mepesuccinate until good glycemic control has been established (see Warnings and Precautions 5.3).

Gastrointestinal Distress

Advise patients that they may experience nausea, diarrhea, abdominal pain, constipation, and vomiting. If these symptoms persist, they should seek medical attention.

Fatigue

Advise patients that SYNRIBO may cause tiredness and to avoid driving any vehicle or operating any dangerous tools or machinery if they experience this side effect.

Rash

Advise patients that they may experience skin rash. Advise patients to immediately report severe or worsening rash or itching.

Alopecia

Advise patients that they may experience hair loss.

Embryo-Fetal Toxicity

Advise pregnant women and females of reproductive potential of the potential risk to a fetus. Advise females to inform their healthcare provider of a known or suspected pregnancy (see Warnings and Precautions 5.4 and Use in Specific Populations 8.1, 8.3). Advise female patients of reproductive potential to use effective contraception during treatment with SYNRIBO and for 6 months after the final dose (see Use in Specific Populations 8.1, 8.3). Advise male patients with female partners of reproductive potential to use effective contraception during treatment with SYNRIBO and for 3 months after the final dose (see Use in Specific Populations 8.3 and Nonclinical Toxicology 13.1)

Lactation

Advise females not to breastfeed during treatment with SYNRIBO and for 2 weeks after the final dose (see Use in Specific Populations 8.2).

Infertility

Advise males of reproductive potential that SYNRIBO may impair fertility (see Use in Specific Populations 8.3).

SYNRIBO® (omacetaxine mepesuccinate) for injection

**What is the most important information I should know about SYNRIBO?**

SYNRIBO can cause serious side effects including:

- **Low blood counts.** Low blood counts are common when using SYNRIBO, including low red blood cells, white blood cells, and platelets, and can be severe. If your white blood cell count becomes very low, you are at increased risk for infection which can lead to death. Your healthcare provider will check your blood counts regularly during treatment with SYNRIBO. Tell your healthcare provider right away if you get any of the following symptoms:
  - fever
  - feeling very tired
  - chills
  - shortness of breath
  - body aches
  - bleeding (see below)

- **Bleeding.** SYNRIBO causes severe low platelet counts that may increase your risk of severe bleeding. Severe low platelet counts can cause you to have bleeding in your brain that can lead to death, or severe stomach bleeding. Your healthcare provider will check your platelet counts regularly during treatment with SYNRIBO. Tell your healthcare provider right away if you get any of the following symptoms:
  - unusual bleeding
  - confusion
  - easy bruising
  - slurred speech
  - blood in urine or stool
  - vision changes

See “What are the possible side effects of SYNRIBO?” for more information about side effects.

**What is SYNRIBO?**

SYNRIBO is a prescription medicine used to treat adults with a type of blood cancer called chronic myeloid leukemia (CML);

- that is in the chronic phase or accelerated phase, and
- who have not responded to (resistant) or cannot tolerate 2 or more medicines called tyrosine kinase inhibitors.

It is not known if SYNRIBO is safe and effective in children.

**Before using SYNRIBO, tell your healthcare provider about all of your medical conditions, including if you:**

- have diabetes or a family history of diabetes
- have bleeding problems
- plan to have any dental or surgical procedures
- are pregnant or plan to become pregnant. SYNRIBO can harm your unborn baby. You should not become pregnant during treatment with SYNRIBO. Tell your healthcare provider right away if you become pregnant or think you may be pregnant during treatment with SYNRIBO.

**Females who are able to become pregnant:**

- Your healthcare provider may give you a pregnancy test before you start treatment with SYNRIBO.
- You should use effective birth control (contraception) during treatment with SYNRIBO and for 6 months after the final dose.

**Males with female partners who are able to become pregnant** should use effective birth control during treatment with SYNRIBO and for 3 months after the final dose.

- are breastfeeding or plan to breastfeed. It is not known if SYNRIBO passes into your breast milk. Do not breastfeed during treatment with SYNRIBO and for 2 weeks after the final dose.

**Tell your healthcare provider about all the medicines you take,** including prescription and over-the-counter medicines, vitamins, and herbal supplements. Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

**How should I use SYNRIBO?**

- Follow the detailed Instructions for Use at the end of this Medication Guide for information about the right way to:
  - properly handle and inject SYNRIBO
  - dispose of used supplies for injecting SYNRIBO
  - clean up any spilled SYNRIBO

- Your healthcare provider will tell you how much SYNRIBO to inject and the timing of when to inject it. Inject SYNRIBO exactly as prescribed.
- Do not change your dose or the timing of when you inject SYNRIBO, unless your healthcare provider tells you to.
- SYNRIBO is given as an injection under the skin (subcutaneous injection) of your thigh or stomach-area (abdomen). The injection can be given in the back of the arm if a caregiver is giving the injection.
- If your healthcare provider decides that you or a caregiver can inject SYNRIBO, your healthcare provider will show you or your caregiver how to prepare for an injection and how to inject SYNRIBO before you use it for the first time.
- Inject SYNRIBO 2 times each day, about every 12 hours.
- Your healthcare provider may tell you to stop using SYNRIBO for a period of time, or tell you to use SYNRIBO less often if you get certain side effects.
- Your healthcare provider will arrange for you to receive syringes filled with SYNRIBO that are ready to inject, along with the other supplies that you will need to inject SYNRIBO. Each syringe contains 1 dose of SYNRIBO as prescribed by your healthcare provider.
- Follow your healthcare provider’s instructions for how to carry (transport) SYNRIBO using ice packs or a cooler.
- Do not eat or drink while handling SYNRIBO.
- Inject SYNRIBO in a place away from children and pregnant women.
- You or your caregiver should wear gloves and protective eyewear, for example protective eyeglasses (not regular eyeglasses) or face shield when handling SYNRIBO and while giving your injection.
- If you or your caregiver get SYNRIBO on your skin, wash the area with soap and water and call your healthcare provider right away.
- If you or your caregiver get SYNRIBO in your eyes, wash your eyes with water and call your healthcare provider right away.
- If you miss a dose of SYNRIBO, just skip the missed dose. Give your next injection of SYNRIBO at your next scheduled time. Do not give 2 doses of SYNRIBO at the same time to make up for a missed dose.
- If you inject too much SYNRIBO, call your healthcare provider or go to the nearest emergency room right away. Follow your healthcare provider’s instructions for when you should inject your next dose of SYNRIBO.
- If someone other than the patient is injected with SYNRIBO, or if anyone accidentally swallows SYNRIBO, call your healthcare provider or get emergency help right away.

**What should I avoid while using SYNRIBO?**

SYNRIBO may cause tiredness. Avoid driving or operating dangerous tools or machinery if you develop tiredness when using SYNRIBO.

**What are the possible side effects of SYNRIBO?**

SYNRIBO may cause serious side effects, including:

- See “What is the most important information I should know about SYNRIBO?”

- **High blood sugar levels (hyperglycemia).** If you have diabetes or are at risk for diabetes, your healthcare provider will check your blood sugar levels often during treatment with SYNRIBO. If you have diabetes or if your blood sugar is not well controlled, your healthcare provider may decide not to start treatment with SYNRIBO until your diabetes is under control first.

**continued**
SYNRIBO® (omacetaxine mespessucinate) for injection

The most common side effects of SYNRIBO include:
• infections. See the information about low blood cell counts in the section “What is the most important information I should know about SYNRIBO?”
• diarrhea
• nausea
• tiredness
• weakness
• redness, swelling, or pain at injection site
• fever

Tell your healthcare provider or get medical help right away if you get
• nausea, diarrhea, stomach (abdominal) pain, severe or worsening skin rash, or itching that does not go away.
• You may have hair loss during treatment with SYNRIBO.
• SYNRIBO may cause fertility problems in males, which may affect your ability to have children. Talk to your healthcare provider if this is a concern for you.
• These are not all of the side effects of SYNRIBO.
• Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store SYNRIBO?
• Carry (transport) SYNRIBO as instructed by your healthcare provider. It is important to use ice packs or a cooler.
• When stored in a refrigerator 36°F to 46°F (2°C to 8°C), use SYNRIBO within 6 days from when it was mixed.
• When stored at room temperature, 68°F to 77°F (20°C to 25°C), use SYNRIBO within 12 hours from when it was mixed.
• When stored in a refrigerator, keep SYNRIBO from coming into contact with food or drink.

Keep SYNRIBO and all medicines out of the reach of children.

General information about the safe and effective use of SYNRIBO.
Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use SYNRIBO for a condition for which it was not prescribed. Do not give SYNRIBO to other people even if they have the same symptoms you have. It may harm them. You can ask your healthcare provider or pharmacist for information about SYNRIBO that is written for health professionals.

What are the ingredients in SYNRIBO?
Active ingredient: omacetaxine mespessucinate
Inactive ingredients: hydrochloric acid, mannitol, sodium bicarbonate

Instructions for Use
SYNRIBO® (sin-RIE-bo)
(omacetaxine mespessucinate) for injection, for subcutaneous use

Read this Instructions for Use before you inject SYNRIBO for the first time and each time you get a refill. Also read the Medication Guide for SYNRIBO.

Before you or your caregiver injects SYNRIBO, your healthcare provider will show you how to properly:
• handle syringes and inject SYNRIBO
• dispose of used supplies for injecting SYNRIBO
• clean up any spilled SYNRIBO

Important:
• Be sure that you store SYNRIBO exactly as your healthcare provider tells you to. See the section “How should I store SYNRIBO?” in the Medication Guide.
• Never try to re-cap the needle. This could cause a needle-stick injury.
• If SYNRIBO comes into contact with your skin, wash the area well with soap and water.

Your healthcare provider will arrange for you to receive all of the supplies that you will need for each injection of SYNRIBO:
• syringe with attached needle, containing SYNRIBO for injection
• protective eyewear, such as protective eyeglasses (not regular eyeglasses) or face shield
• gloves
• disposal biohazard container
• absorbent pads for use to clean up an accidental spill of SYNRIBO
• alcohol swabs
• gauze pads

You may also need an adhesive bandage.

Never mix SYNRIBO yourself. If you don’t receive syringes already filled with SYNRIBO, contact your doctor or pharmacy.

Step 1. Preparing to give an injection of SYNRIBO.
• Find a clean flat work surface.
• Wash your hands well with soap and water.
• Put on a pair of gloves and your protective eyewear before you handle the syringe containing SYNRIBO. Wearing gloves and protective eyewear (even if you wear glasses) protects you from splashes or spills. See Figure A.
• Look at the date printed on the syringe label to make sure that the expiration date has not passed. Do not use if the expiration date has passed and contact your doctor or pharmacy immediately.
• Gather the rest of your supplies and place them on your work surface.

Figure A

Step 2. Choose an injection site.
• You may inject SYNRIBO into your thigh or stomach-area (abdomen). See Figure B. The injection can be given in the back of your arm if a caregiver is giving the injection. See Figure C.
• Use a different site for each injection to help decrease tenderness at the injection site. Each injection site should be at least 1 inch away from any recently used injection site.
• Do not inject SYNRIBO into areas of your skin that are tender, red, bruised, hard, or that have scars or stretch marks.
Step 3. Prepare the injection site.
• Clean the injection site well with an alcohol wipe and allow it to air dry. See Figure D.

Step 4. Inject SYNRIBO.
• Carefully remove the needle cap by pulling, taking care not to stick yourself. See Figure E.
• Do not press down on the plunger.
• With one hand, pinch skin of injection site between your thumb and forefinger. See Figure F.
• With your other hand, hold the syringe at a 45 degree or 90 degree angle to your skin. Use a quick dart-like motion to insert the needle through the skin at the injection site. See Figures G and H. The needle should go through the skin but not into your muscle.
• Slowly push down on the plunger with your thumb until syringe is empty. See Figure I.
• Stop pinching your skin. Quickly remove needle and then apply pressure on injection site with a dry gauze pad. You can put a small adhesive bandage over the injection site if there is bleeding. See Figure J.
• Follow the instructions below for how to dispose of the syringe, needle, and other supplies used to give your injection. Never try to re-cap the needle. This could cause a needle-stick injury.
• Remove your gloves. Wash your hands right away with soap and water, and then remove your protective eyewear.

How should I throw away (dispose of) used SYNRIBO syringes, needles, and other supplies?
• Throw away (dispose of) used SYNRIBO syringes, needles, gloves, and other used supplies in an appropriate biohazard container.
• Return the biohazard container to your healthcare provider for disposal.
• Do not place used syringes, needles, or other supplies in a household trash or recycle container. Do not re-cap or clip the used needle. This could cause a needle-stick injury.
• Do not throw away the protective eyewear. You will need them for each dose of SYNRIBO.

What should I do in case of an accidental SYNRIBO spill?
• Your healthcare provider will arrange for you to receive supplies to use in case you spill SYNRIBO.
• Follow your healthcare provider’s instructions about how to clean up a SYNRIBO spill.
• Do not touch a spill unless you are wearing gloves and protective eyewear.
• Use an absorbent pad to wipe up the spill. Wash the area with soap and water. Use an extra absorbent pad or paper towel to dry the area.
• Place the pad, gloves, and other supplies that were used to clean the spill in the biohazard container.
• Call your healthcare provider right away to report the spill.

This Instructions for Use has been approved by the U.S. Food and Drug Administration.
